

# A dual concept of spherical $s$ -distance sets

**Hiroshi Nozaki**

(Aichi University of Education)

## **Abstract**

A dual concept of spherical  $s$ -distance sets is a connected regular graph with distinct  $s + 1$  eigenvalues. In this talk, we explain why it is, and show a linear programming bound for the size of a regular graph. The LP bound is given by only distinct eigenvalues without multiplicities.
